Operator software XiCon for an X-Y-positioner

The X-Y-positioners for full car test rigs and 4-poster test rigs are equipped with a PC control system. Our software XiCon allows the automatic as well as semiautomatic and manual adjustment of the positioner units according to various vehicle dimensions. Within the framework of the special positioner system you can store any wheel base and track widths into the integrated data base. In addition the screen displays the actual position of the positioner units as well as the status of the control system.
